

ABSTRACT OF THE DISCLOSURE

A device for dispensing medicine includes a dispensing
5 device body (1), a cassette (2) fixed removably to the
dispensing device body in order to contain medicines while
arranging, and a pushing mechanism (18) for pushing out the
medicines in the cassette (2) toward one end side. The
cassette (2) includes a cover (6) and a stopping/receiving
10 part (17) disposed internally in the longitudinal direction.
The pushing mechanism (18) includes an abutting part (19a)
contained in the cassette (2) and abutting against the
medicines, a biasing part (20) for biasing the abutting part
(19a) against the medicine, and a stopping part (21) stopping
15 at the stopping/receiving part (17) of the cassette (2) only
when the cover (6) is opened. Consequently, the cassettes
(2) can be arranged at a high density and a desired number of
medicines can be dispensed surely.
